

# Divergent Effects of Internet Use on Government Trust and Political Participation in Central Asia

Valery Dzutsati<sup>1</sup>    Dinara Rakhmatullayeva<sup>2</sup>

<sup>1</sup>Southern Illinois University

<sup>2</sup>Al-Farabi Kazakh National University

May 16, 2024

- How does the Internet affect trust in government and political participation?

# Internet and Political Trust

- E-governance is associated with greater transparency and greater political trust among the population (Welch, Hinnant, and Moon 2005)
- An increase in internet usage is associated with citizens' distrust in political institutions (Im et al. 2014; You and Wang 2020)

# How the Internet Challenges Authoritarian Regimes

- The internet expands the opportunities for mass mobilization of citizens and upending authoritarian regimes (Diamond and Plattner 2012)
- Authoritarian regimes restrict the offline activities of their citizens, which inadvertently amplifies internet-active citizens' discontent (Han and Jia 2018; You and Wang 2020)

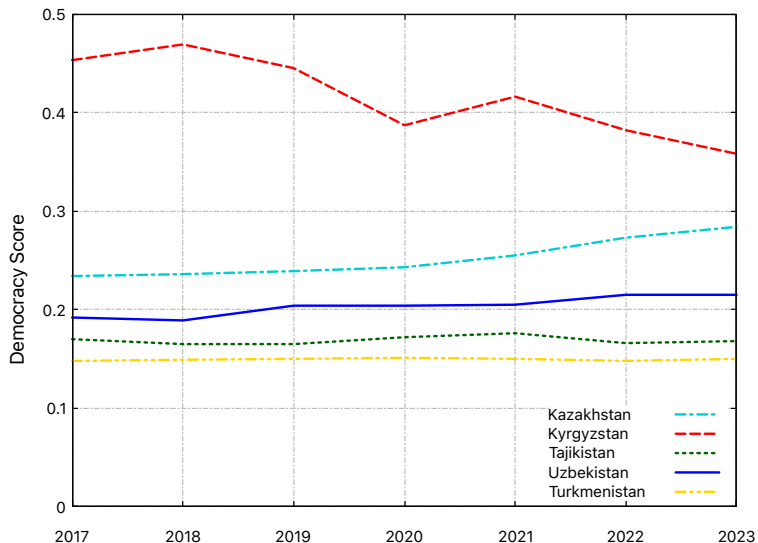

# How Authoritarian Regimes Respond to the Challenge of the Internet

- Autocratic regimes use the Internet and social media for surveillance, propaganda, censorship, and to distract voters from politics (Morozov 2012; Zhuravskaya, Petrova, and Enikolopov 2020)
- Some authoritarian regimes have learned to use technology and control the dominant narratives sometimes relying on old but effective media resources such as TV (Walker and Orttung 2014; Szostek 2018)

# Internet and Politics in Central Asia

- Authoritarianism across Central Asian countries varies (Lewis 2021)
- Internet accessibility has been on the rise in Central Asia in the past several years
- Some news internet websites are blocked, but the internet is still much harder to control than the traditional media (Bekmagambetov et al. 2018; Reyaz 2020)

# Democracy Scores in Central Asian Countries, VDem, 2017-2023

# Contribution

- Theoretical distinction between the active and passive internet use
- Test using panel data

# Exposure to the Internet. Passive Use

- Greater exposure to the Internet will result in citizens becoming more informed and engaged with political and social issues
- In an authoritarian context, where offline activities are severely restricted, disaffected individuals are likely to use the internet more intensively  $\implies$
- A greater level of access of individuals to the internet in authoritarian countries will be associated with lower trust in the government

# Content Creation in Social Media. Active Use

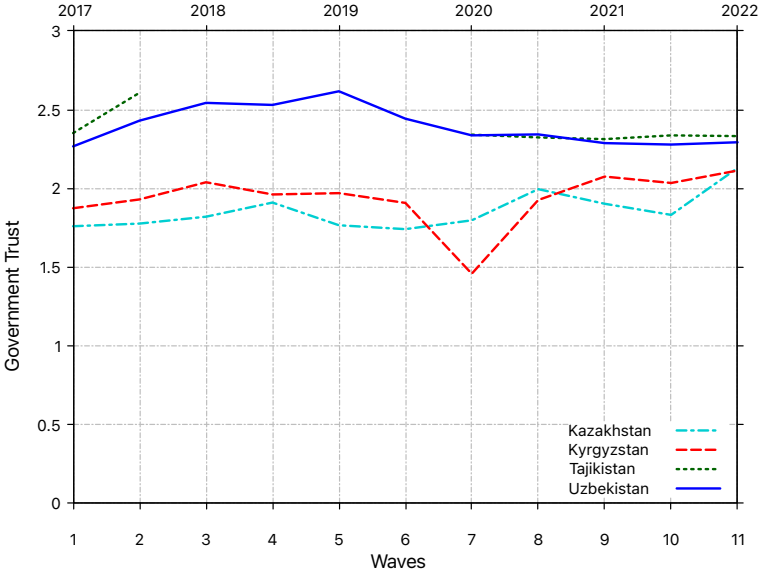

- When individuals in authoritarian countries create internet social media content, their activities are often subject to censorship and surveillance by the government
- This can lead to self-censorship by individuals and limit their ability to express opinions that are critical of the government  $\implies$
- Greater involvement of individuals in internet content creation in authoritarian countries will be associated with higher trust in the government

- Central Asian Barometer Survey data
- Kazakhstan, Kyrgyzstan, Tajikistan, and Uzbekistan
- Waves 1-11, 2017-2022 (two waves per year)

# Dependent Variables

- An index variable measuring government trust:
  - Things in the respondent's country are headed in the right direction or the wrong direction, dichotomous 0, 1
  - The economic situation in the respondent's country is better or worse than it was one year earlier, ordinal 1-5
- A dichotomous variable measuring respondents' proclivity to vote in parliamentary elections (only Kazakhstan and Kyrgyzstan)

# Government Trust

# Independent Variables

- A measurement of internet access via phone or computer in the past 6 months from “never” to “daily.”
- Internet as the main source of national news, 0, 1
- The creation of content online by posting comments, writing a blog: from 1 – “never” to 6 – “at least once a day”
- Control variables: unemployed, income, age, education, gender, urban

# Internet Access

# Internet and Government Trust. OLS with Country and Time Fixed Effects

# Internet and Political Participation. Logit with Time Fixed Effects

# Marginal effects. OLS

(a) Usage of Internet

(b) Internet News

(c) Government News

(d) Internet Content Creation

# Marginal effects. Logit

(a) Usage of Internet

(b) Internet News

(c) Government News

(d) Internet Content Creation

# Conclusions

- The more widely individuals use the internet, the less they trust the government in an authoritarian context
- Online content creation is associated with higher levels of government trust
- As access to the Internet becomes more common, respondent's attitudes might become more diverse
- Responses to sensitive questions in authoritarian countries may be biased

# The End
